

Exam: Sampling Methods

Multiple Choice (Single Select) - 4 Answer Options

1. What is a simple random sample?

- A) Every element has equal selection probability
- B) A snowball sample
- C) An arbitrary selection
- D) A deliberate selection of experts

2. What is stratified sampling?

- A) Quota sampling
- B) Snowball sampling
- C) Population divided into strata, then random sample per stratum
- D) Selection of clusters, then all within

3. What is the design effect?

- A) The effect size
- B) The intervention effect
- C) Variance increase due to complex sampling design
- D) Statistical power

4. Which method is suitable for hard-to-reach populations?

- A) Snowball sampling
- B) Stratified sampling
- C) Cluster sampling
- D) Simple random sample

5. What is nonresponse?

- A) Selected individuals do not participate
- B) Sample too small
- C) Systematic error
- D) Measurement error

6. What is selection bias?

- A) Random error
- B) Measurement error
- C) Sampling error
- D) Participants differ systematically from non-participants

7. What is post-stratification weighting?

- A) Removing measurement errors
- B) Increasing sample size
- C) Adjusting the sample to known population distributions
- D) Reducing variance

8. What is quota sampling?

- A) A random selection
- B) A census
- C) Selection according to predetermined quotas, not random
- D) Cluster sampling

Solutions

1: A

2: C

3: C

4: A

5: A

6: D

7: C

8: C
